T. A. EDISON. Electric-Lamp.

No. 223,898.

Patented Jan. 27, 1880.

aly,

UNITED STATES PATENT **OFFICE.**

THOMAS A. EDISON, OF MENLO PARK, NEW JERSEY

ELECTRIC LAMP.

SPECIFICATION forming part of Lotters Patent No. 223,896, dated January 27, 1986. ation find November 6, 1878. Asoli

To all whom it may concern:

Be it known that I, TACHAS ALVA EDDON, of Menle Park, in the State of New Jersey, United States of America, have invented an 5 Improvement in Electric Lamps, and in the method of manufacturing the mane, (Case No.

- 186,) of which the following is a specification. The object of this invention is to produce electric lamps giving light by incandescence,
- ro which lamps shall have high resistance, so as to allow of the practical subdivision of the electric light.

The invention consists is a light-giving body of carbon wire or abeets coiled or arranged in

- 15 such a manner as to offer greet resistance to the passage of the electric current, and at the same time present but a slight surface from which radiation can take place.
- The invention further consists in placing so such burner of great resistance in a nearlyeffect vacuum, to prevent oxidation and injary to the conductor by the atmosphere. The current is conducted into the vacuum-bulb through platins wires scaled into the glass.
- The invention further consists in the method of manufacturing carbon conductors of high resistance, so as to be suitable for giving light by incandescence, and in the manner of securing perfect contact between the metallic con-
- 30 ductors or leading wires and the carbon conductor.

Heretofere light by incandescence has been obtained from rods of carbon of one to four ohms resistance, placed in closed vessels, in

- 35 which the atmospheric air has been replaced by gases that do not combine chemically with the carbon. The vessel holding the burner has been composed of glass comented to a metallic base. The connection Letween the lead-
- 40 log wires and the carbon has been obtained by clamping the carbon to the metal. The loading-wires have always been large, so that their resistance shall be many times less than the burner, and, in general, the attempts of pre-
- 45 vious persons have been to reduce the resistance of the carbon rod. The disadvantages of following this practice are, that a lamp having but one to four ohme resistance cannot be worked in great numbers in multiple arc without the em-
- 50 ployment of main conductors of enormous dimensions; that, owing to the low resistance of the lamp, the leading wires must be of large | bonization there is an intimate union by com-

dimensions and good conductors, and a glass globe cannot be kept tight at the place where the wires pass in and are comented; hence the 55 carbon is consumed, because there must be almost a perfect vacuum to render the carbon stable, sepecially when such carbon is small in mass and high in electrical resistance.

The use of a gas in the receiver at the st- 60 mospharic pressure, although not attacking the carbon, serves to destroy it in time by "sirwashing," or the attrition produced by the rapid passage of the air over the slightly-coherent highly-heated anriace of the carbon. I 65 have reversed this practice. I have discovered that even a cotton thread properly carbonized and placed in a sealed giass bulb exhausted to one-millionth of an atmosphere offers from one hundred to five hundred ohms resistance to the 70 passage of the current, and that it is absolutely stable at very high temperatures; that if the thread be coiled as a spiral and carbonized, or if any fibrous vegetable substance which will leave a carbou residue after heating in a 75 closed chamber be so coiled, as much as two thousand ohms resistance may be obtained without presenting a radiating-surface greater than three-sixteenths of an inch; that if such fibrous material be rubbed with a plastic com- 80 posed of lamp-black and tar, its resistance may be made high or low, according to the amount of lamp-black placed upon it; that carbon filamento may be made by a combination of tar and lamp-black, the latter being pre- 85 viously ignited in a closed crucible for several hours and afterward moistened and kneaded until it assumes the consistency of thick putty. Small pieces of this material may be rolled out in the form of wire as small as seven 90 one-thousandths of a inch in diameter and over a foot in length, and the same may be coved with a non-conducting non-carbonizing salamance and wound on a bobbin, or as a spiral, and the tar carbonized in a closed cham- 95 ber by subjecting it to high heat, the spiral

after carbonization retaining its form. All these forms are fragile and cannot be clamped to the leading wires with sufficient force to insure good contact and prevent beat- 100 ing. I have discovered that if platinum wires are used and the plastic lamp-black and tar material be molded around it in the set of car-

material be molded around it in the act of carbonization there is an intimate union by combination and by pressure between the carbon and platina, and nearly perfect contact is ob-

5 tained without the necessity of clamps; hence the burner and the leading-wires are connected to the carbon ready to be placed in the vacuum-bulb.

When fibrous material is used the plastic to lamp-black and tar are used to secure it to the plating before carbonizing.

By using the carbon wire of such high resistance I am enabled to use fine platinam wires for leading-wires, as they will have a

15 small resistance compared to the burner, and hence will not heat and crack the scaled vacunm-bulb. Platina can only be used, as its expansion is nearly the same as that of glass. By using a considerable length of carbon

20 wire and coiling it the exterior, which is only a small portion of its entire surface, will form the principal radiating surface; hence I am able to raise the specific heat of the whole of the carbon, and thus prevent the rapid recep-

25 tion and disappearance of the light, which on a plain wire is prejudicial, as it shows the least unsteadiness of the current by the flickering of the light; but if the current is steady the defect does not show.

30 I have carbonized and used cotton and lineu thread, wood splints, papers coiled in various ways, also lamp-black, plumbago, and carbon in various forms, mixed with tar and kneaded so that the same may be rolled out into wires

35 of various lengths and diameters. Each wire, however, is to be uniform in size throughout. If the carbon thread is liable to be distorted during carbonization it is to be coiled between a helix of copper wire. The ends of the car-

40 bon or filament are secured to the plating leading-wires by plastic carbonizable material, and the whole placed in the carbonizing-chamber. The copper, which has served to prevent distortion of the carbon thread, is afterward

45 eaten away by nitric acid, and the spiral soaked in water, and then dried and placed on the glass holder, and a glass bulb blown over the whole, with a leading-tube for exhaustion by a mercury-pump. This tube, when a high vacuum has been reached, is hermetically 50 sealed.

With substances which are not greatly distorted in carbonizing, they may be coated with a non-conducting non-carbonizable substance, which allows one coil or turn of the carbon to 55 rest upon and be supported by the other.

In the drawings, Figure 1 shows the lamp sectionally. *a* is the carbon spiral or thread. *c* σ' are the thickened ends of the spiral, formed of the plastic compound of lamp-black and tar. 60 *d d'* are the platina wires. *A* h are the clamps, which serve to connect the platina wires, comented in the carbon, with the leading-wires x x, scaled in the glass vacuum-bulb. *c* σ are copper wires, connected just outside the bulb 65 to the wires x x. *m* is the tube (shown by dotted lines) leading to the vacuum-pump, which, after exhaustion, is hermetically scaled and the surplus removed.

Fig. 2 represents the plastic material before 70 being wound into a spiral.

Fig. 3 shows the spiral after carbonization, ready to have a bulb blown over it.

I claim as my invention-

1. An electric lamp for giving light by in-75 candescence, consisting of a filament of carbon of high resistance, made as described, and secured to metallic wires, as set forth.

2. The combination of carbon filaments with a receiver made entirely of glass and conduct- 80 ors passing through the glass, and from which receiver the air is exhausted, for the purposes set forth.

3. A carbon filament or strip coiled and connected to electric conductors so that only 85 a portion of the surface of such carbon conductors shall be exposed for radiating light, as set forth.

4. The method herein described of secaring the platius contact-wires to the carbon fils. 90 ment and carbonizing of the whole in a closed chamber, substantially as set forth.

Signed by me this lat day of November, A. D. 1879.

THOMAS A. EDISON.

Witnesses: S. L. GEIFFIN, JOHN F. BANDOLPH.

Correction

It is found that the following certificate has been attached to Letters Patent granted to Thomas A. Edison for improvement in "Biestrie Lamps," No. 223,898, dated January 27, 1880:

DEPARTMENT OF THE INTERIOR,

UNITED STATES PATENT OFFICE.

WARHINGTON, D. O., December 18, 1863.

In compliance with the request of the party in interest Letters Patent No. 233,896, granted January 27, 1880, to Thomas A. Edison, of Menio Park, New Jersey, for an improvement in "Electric Lamps," is hereby limited so as to expire at the same time with the patent of the following-named, having the shortest time to run, viz.: British patent, duted November 10, 1879, No. 4,576; Canadian patent, dated November 17, 1879, No. 10,654; Belgian patent, dated November 39, 1879, No. 49,884; Italian patent, dated December 6, 1879, and French patent, dated January 20, 1880, No. 133,756.

It is hereby certified that the proper entries and corrections have been made in the files and records of the Patent Office.

This amondment is made that the United States patent may conform to the provisions of section 4887 of the Bevised Statutes.

BENJ. BUTTERWORTH. SEAL. Commissioner of Patents.

Approved: M. L. JOSLYN,

Acting Secretary of the Interior.

Now, in compliance with the request of the parties in interest, said certificate is hereby canceled and proper entries and corrections have been made in the files and records of the Patent Office.

In testimony whereof I have bereanto set my hand and caused the seal of the Patent Office to be affixed, this 15th day of March, 1893.

W. R. SIMONDS. Commissioner of Patents.

Approved: OTRUE BUSARY. Assistant Boorstary of the Interior.

DEPARTMENT OF THE INTERIOR. UNITED STATES PATENT OFFICE,

WAREINGTON, D. C., Descaber 18, 1888.

In compliance with the request of the party in interest, Lotters Patent No. 233,986, granted January 27, 1880, to Thomas A. Edison, of Menio Park, New Jerrey, for an improvement in "Electric-Lamps," is hereby limited so as to expire at the same time with the patent of the following named, having the shortset time to run, vis: British Patent dated November 10, 1879, No. 4,576; Canadian Patent dated November 17, 1879, No. 10,654; Belgian Patent dated November 29, 1879, No. 49,584; Italian Patent dated December 0, 1879; and Franch Patent dated January 20, 1880, No. 183,756; It is hereby certified that the proper surface and corrections have been made in the files and records of the Patent Office.

files and records of the Patent Office

This anusudment is made that the United States Patent may conform to the provis-ious of Section 4887 of the Revised Statutes.

BENJ. BUTTERWORTH,

Commissioner of Patents.

Approvad:

M. L. JOSLYN, Assing Burstory of the Interior.
